Samuel Hollander, Letter to Ronald Meek July 16, 1963  
raises the question that CPE had a rigid B relationship  
between inputs and outputs - would like Meek's view on it.

Ronald Meek to <sup>letter</sup> Samuel Hollander August 16, 1963

"It was good to find that someone had at last begun to concern himself with the implications and effects of the old classical assumption of fixed technical coefficients. I think you are absolutely right to see this as something very important: we are all too often liable to talk as if the present-day assumption of the variability of coefficients had always been made by economists, whereas it seems in fact to be a very modern innovation (made by Marshall and Pigou, I suspect). And very few people, apart from Maurice Lobb, have thrown any doubt upon its validity. This is strange, since this question is obviously very relevant to the critique of Keynesian economics."
